WHERE CAN THIS BE USED?

1. Limited Wall Space Between Doors or Architrave

In many properties, switches are positioned between two door openings or close to an architrave, where wall space is extremely limited. Traditionally, this restricts installations to a maximum of 3 gangs on a single plate, as 4-gang switches normally require a larger double plate.

With the 4 Gang Single Plate Switch, installers can now:

- Fit up to four circuits in tight spaces
- Avoid increasing the plate size
- Maintain a clean, balanced appearance without compromising functionality

2. Adding Circuits Without Chasing the Wall

In hallways or living areas, it's common to already have a 2 or 3 gang single plate controlling multiple lights. When an additional circuit is required — such as a new light fitting or outdoor lighting — the usual solution is to chase the wall and install a double plate.

The 4 Gang Single Plate Switch eliminates this need by:

- Allowing an additional circuit to be added within the existing single plate footprint
- Reducing installation time and mess
- Avoiding redecoration costs for the end user
